More than what you think.

Selenium 4 Java Project and Adding sources

Agenda

Using jdk17

Selenium 4.10.0 project

Adding Script

Download Java Bindings

Extract Sources Separately

Include Sources in Project

Using jdk 17

- Selenium 4 will stop supporting java 8 after September 23, so there is need to move to higher version of Java.
- Download jdk 17 from Oracle
- https://download.oracle.com/java/17/archive/jdk-17.0.7_windows-x64_bin.exe (This is for windows)
- In eclipse, go to Windows menu and select Preferences to open new window, there expand java and click on Installed JRE's
- Add Standard VM and Set JDK17 installation path as a default jdk for all projects

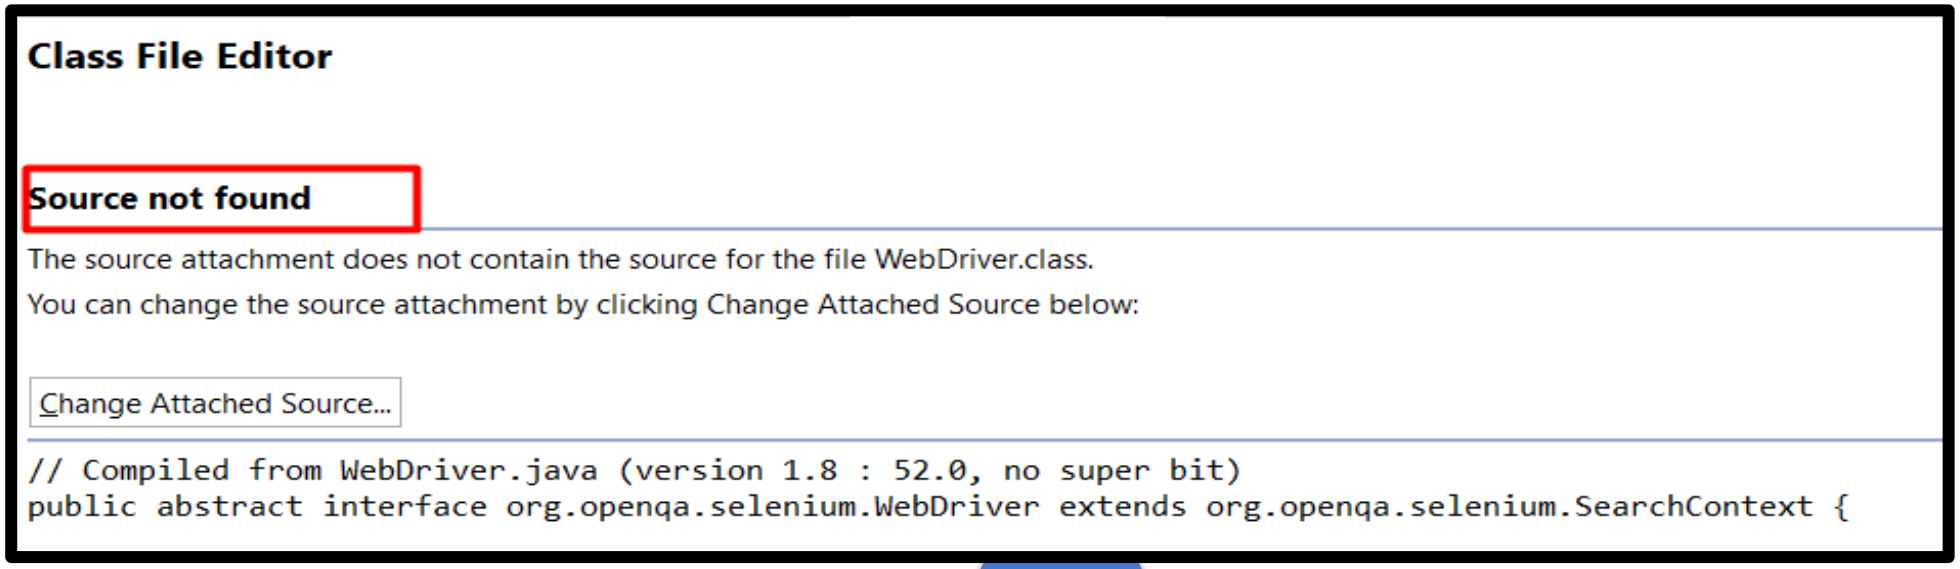
Selenium 4.10.0 project

- Create a simple Java Project say "SeleniumOne" and create folder lib.
- Download the latest stable version "selenium-server-4.10.0.jar" from seleniumdev portal.

- Place the selenium jar in the jars directory within lib folder of your Java project.
- Now add the selenium jar in the properties of the project.
- *Project Properties > Java Build Path > Libraries Tab(classpath) > Add Jars(select path)*

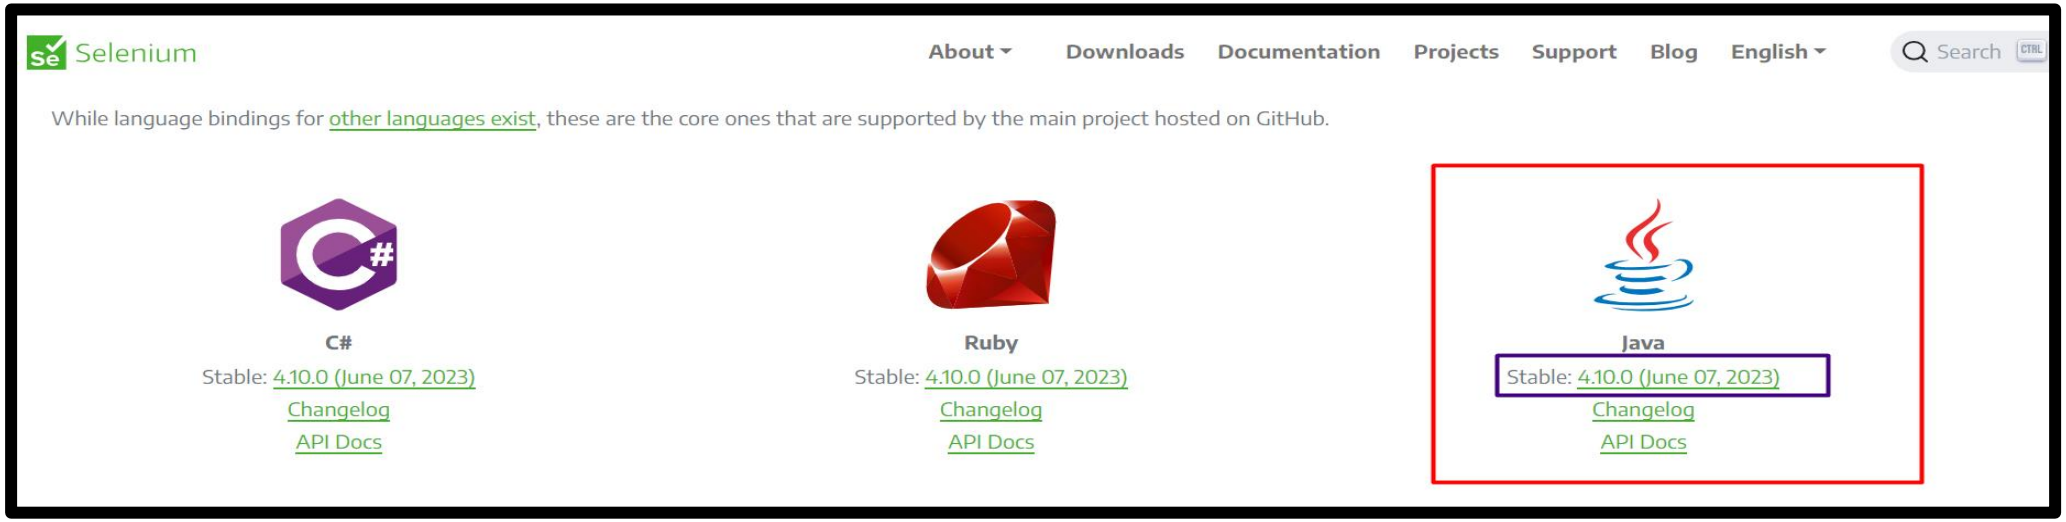
Adding Script

- I have added simple login and logout script at box portal using explicit waits.
- You will see there is no need to set property for browser driver path and we can instantiate driver directly.
- Now, if you control click on WebDriver interface or Chrome Driver class, instead of opening Javadoc class, it will ask you to attach source.



Download Java Bindings

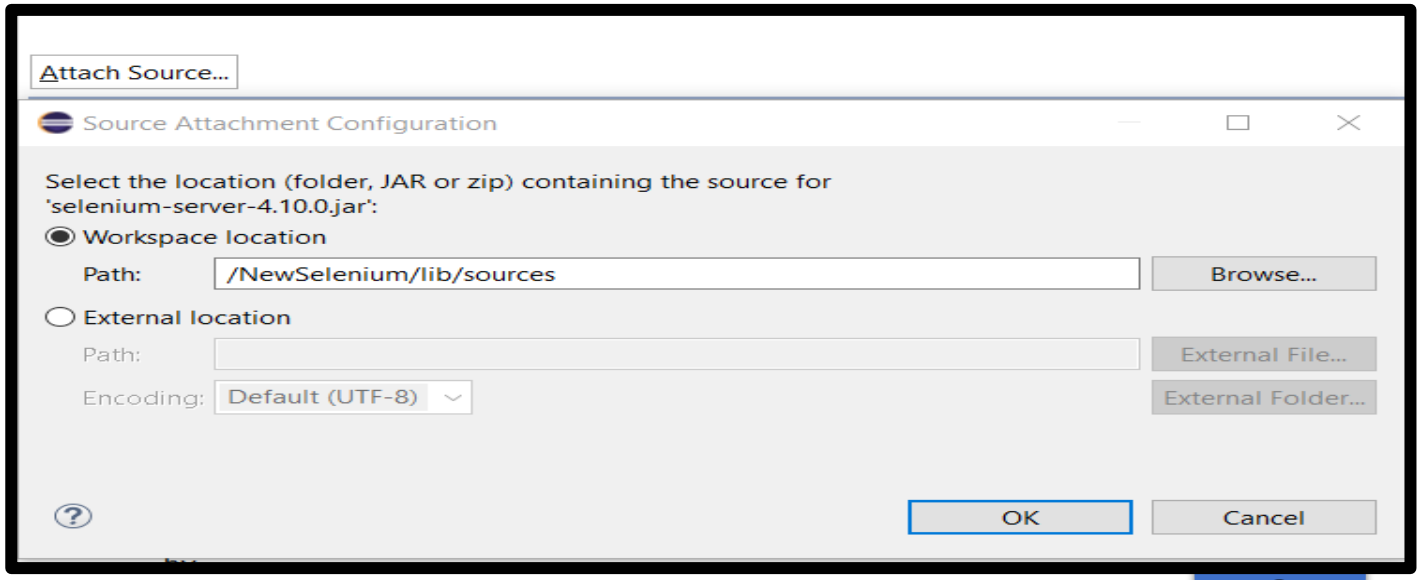
- Source is needed to be downloaded from selenium portal as java binding. (selenium-java-4.10.0.zip file)



- Extract this zip file in new folder say "selenium4_java_bindings".
- This folder will contain all class file jars and sources jars(java file).

Extract Sources Separately

- In java bindings folder select all sources file and put them inside new folder say "sources".
- Go inside sources folder and from there run the command prompt and extract all sources jars one by one with command:-
- *jar –xvf selenium-xxx-sources.jar*
- New folder will be created with path like *org>openqa>selenium*
- This path will contain all selenium java files.

Include Sources in Project


- Copy this sources folder with selenium java files and paste in the selenium java project within "lib" folder.
- Now control-click on WebDriver in your script file and click on "Attach Source" button.
- Browse to the path of "sources" folder and complete the configuration. You are now able to see JavaDoc.
